AirSanitizer

The air purifier made for busy rooms that require optimal indoor air quality.

When a high number of people are present or moving throughout internal spaces, air quality deteriorates without suitable ventilation. Polluted room air is proven to be a transmission path for potentially pathogenic viruses, bacteria and spores.

The AirSanitizer can provide occupants of these areas such as classrooms, gyms, cafes, hotel rooms, restaurants and offices with a higher level of air quality and protection.

Quiet operation

99.95% germ and bacteria free air

Hospital grade filters

How Does It Work?

The AirSanitizer recycles existing and contaminated air in a room or internal space using high performance filters, and immediately releases clean air back into the space. Filters used in the AirSanitizer are commonly used in hospitals and reliably filter out 99.95% of all viruses, bacteria and germs as well as fine dust particles.

This protects occupants from germs and viruses as well as improves air quality for better concentration, easier breathing for allergy sufferers and overall higher comfort levels.

The Design

With the easy 'plug and play" design the AirSanitizer can be installed directly into any room with a normal household socket for immediate use.

Available in two sizes with smooth and robust surfaces the AirSanitizer has been designed for discreet display in a wide variety of visual areas.

Equipped with high-performance silencers and practically inaudible in operation, the unit is suitable for even the quietest of spaces.
